

Battery connection of communication base station to inverter

Overview

How does a battery-inverter system work?

In a power system with closed-loop communication, the inverter, solar charge controllers, and other components do not control the battery. Instead, the battery informs the decisions made by everything else in the system. The performance of any battery-inverter combination depends on how effectively the battery can fulfill this role.

How do you connect a battery to an inverter?

Use the wires from the same twisted pair for the A and B wires between the battery and the inverter. On the inverter side, connect the communication cable to the RS485-1 port, as displayed below. Close the communication gland with a 5.5 N·m. Connect the DC cables to the battery, as displayed in the image above.

What makes a good battery-inverter combination?

The performance of any battery-inverter combination depends on how effectively the battery can fulfill this role. For the battery to receive what it needs and for the system to operate at peak performance, these control messages must be accurate and well-understood by the rest of the system. As you will see, this is not always a given.

What is a basic battery communication system?

As you will see, this is not always a given. In a basic battery communication system, the main information shared is the battery telling the inverter whether or not it will accept or give a current at this moment. A system with basic communication offers reliability and noticeable performance advantages over non-communicating lithium batteries.

Do inverters and batteries need to match?

The inverter and batteries must match in terms of voltage, capacity, and

power output. If you are using a 12V battery, then the input voltage of the inverter must match the battery voltage. If the specifications of the battery and the inverter do not match, the system will not operate stably and may even damage the equipment.

Do inverters need to be connected to batteries?

Connecting inverters to batteries is an important part of an off-grid power solution or backup power system, and the right connections ensure that the system runs efficiently.
