

Classification standards for containerized energy storage vehicles

Overview

What are the classification and shipping requirements for lithium-ion batteries?

The classification and shipping requirements for lithium-ion batteries depend on their size and energy capacity (Watt-hours). For standalone batteries. Strict UN-certified packaging. IUMI strongly supports the SoC limit of 30% for air freight and advocates similar principles for maritime transport.

What are the new requirements for the transport of damaged/defective units?

Damaged/Defective Units: Dedicated special provisions (SP 376, SP 377) for the transport of damaged/defective or disposal/recycling units, mandating robust, approved packaging and clear labeling. Updated Marking and Labeling: New requirements for the "LITHIUM BATTERY" mark and specific hazard labels.

What are the requirements for securing a cargo?

Securing: All cargo must be secured within its container and on the vessel in accordance with the CTU Code and the vessel's Cargo Securing Manual. For BESS on bulk carriers, any welding for securing points must be completed before the cargo is loaded. Standard firefighting for a lithium battery incident.

How should a lithium battery container be segregated?

This allows for crew access for boundary cooling with fire hoses and permits flammable gases to vent to the atmosphere. Segregation: It is recommended to segregate lithium battery containers from those containing other dangerous goods, particularly flammables, by at least one container bay (6 meters).

What are the new packaging requirements for lithium ion batteries?

Revised Packing Instructions: More stringent requirements for UN-certified packaging, capable of withstanding specific drop tests. State of Charge (SoC) Emphasis: Increased scrutiny on the SoC for standalone lithium-ion battery

shipments, with a general requirement not to exceed 30% of rated capacity.

Classification standards for containerized energy storage vehicles

Requirements for Shipping Lithium Batteries 2025

Cabinet-type systems must meet requirements for structural integrity, while containerized systems must meet the standards of the International Convention for Safe Containers (CSC).
