

Correct installation of Spanish solar pumps

Overview

How do you design a solar water pumping system?

When designing a solar pumping system, the designer must match the individual components together. A solar water pumping system consists of three major components: the solar array, pump controller and electric water pump (motor and pump) as shown in Figure 1.

How to install a solar water pump?

For tip number three on solar water pump installation, focus on the correct orientation of panels. In the Southern Hemisphere, like in South Africa, aim the panels to face True North. Match the panel's angle to your location's latitude, which is easily searchable online. A 10-degree deviation is generally acceptable.

How to choose a solar water pumping system?

The type of solar water pumping system: borehole/well (submerged), floating or surface will depend on the water source. If the source is a borehole (proposed or existing) or deep well, then a submersible pump that fits the borehole or well should be selected. If the water source is a river, then a surface pump should usually be selected.

Do solar water pumps need to be waterproof?

Solar water pumps need to be waterproof and moisture-proof to avoid malfunctions caused by dampness and affecting the normal operation of the water pumps. Below, TPON will introduce you to the installation methods of solar water pumps. Preparation before installation of solar water pump 1.

How long does a solar water pump installation take?

The duration of a solar water pump installation varies based on factors such as the installer's experience, site conditions, and system complexity. On average, a professional installer may complete the setup in one to two days. This

timeframe underscores the efficiency and relatively quick implementation of solar water pump systems.

How should solar panels be installed?

Solar panels should be installed in an unobstructed, well-lit area, preferably with at least 6 hours of direct sunlight per day. The installation height of the pump should be determined according to the depth of the water source and the water demand, and it should not be too deep from the water surface to avoid increasing the burden of pumping.
