

Demand for indium in photovoltaic solar panels

Overview

Will indium production lag behind demand for photovoltaic solar panels?

Boosting this could greatly alleviate supply pressures. Projections indicate that indium production will reach its peak between 2025 and 2030, while the peak for photovoltaic solar panels due to indium shortages is anticipated around 2090, with an installed capacity of 1200 GW. Thus, the growth of photovoltaic capacity may lag behind actual demand.

What percentage of indium will be used in solar PV?

A forecast for 2050 indicates that around 97 percent of the indium used for energy technologies will be used in solar PV, mainly for the construction of CIGS (copper indium gallium selenide) solar cells. Get notified via email when this statistic is updated. Projection under the two degrees scenario. Access All Statistics. Starting from.

What role will electronics and photovoltaic industries play in indium demand?

Indium demand in the electronics and photovoltaic industries is crucial. We assess their indium demand using three cumulative photovoltaic capacity scenarios (8.5, 14, and 60 TW by 2050) with different dominant photovoltaic sub-technologies.

How many photovoltaic technologies require indium?

Ten of these photovoltaic technologies require indium, five of them require gallium in addition to indium, three of them require antimony in addition to indium, one technology requires tellurium in addition to indium, three of them require selenium in addition to indium and six of them demand silver in addition to indium.

Does the indium price increase enough to increase photovoltaic capacity?

The indium price does increase enough to increase the indium recycling some, but yields limitations prevail. The result shows that the photovoltaic capacity

demanded is far larger than what can be realized in reality. It appears to be not enough indium available.

Do solar panels use indium?

Many of the different solar panel technologies use indium in small amounts (Tables 1 and 2). The solar conversion efficiency is expected to reach 35% in the near future (Kopidakis, 2023) for the technologies using indium.

Demand for indium in photovoltaic solar panels

<u>State of global solar energy market: Overview, China's role, ...</u>

The rest of this article is organized as follows: Section 2 will introduce the global demand for solar PV while defining the two main PVs: Silicon PV and Thin-film PV, as well as ...
