

Differences between bifacial modules and double-glass modules

Overview

Should bifacial panels have double/dual glass?

These days, many bifacial panel designs incorporate double/dual glass at the rear of the modules. Glass-glass panels seems to better transmit light and are more resistant to unpredictable weather, moisture, corrosion, and have good mechanical load capacity.

Do bifacial modules come with frames?

As a result, most glass-glass modules come with frames in place. Compared with standard glass backsheet technology, framed modules with two layers of glass are heavier. Therefore, transparent backsheets are a solution for a lighter bifacial module. A more lightweight module means less cost on transportation, labor, and trackers whenever applicable.

Why are glass-glass bifacial modules becoming more popular?

Due to their better reliability, glass-glass bifacial configurations have a larger portion of the worldwide bifacial module market share. Glass shortages, weight concerns for larger format modules, and decreasing prices for transparent backsheets have caused some manufacturers to switch to a glass-transparent backsheet structure.

What is the difference between bifacial and double glazed panels?

The double-glazed design gives them a transparent or translucent appearance, which is different from the opaque single-sided panels. Main difference: The design of single-sided panels is simpler and lighter, while bifacial double-glazed panels are heavier and have a more complex and modern appearance due to the double-glazed structure. 2.

What is a bifacial solar module?

The front of a bifacial solar module is covered with a protective glass and the rear side may be made of either glass or transparent polymer backsheet that

allows sunlight to pass through. This stands in contrast to conventional solar panels which have opaque backsheets.

What is bifacial glass technology?

Bifacial glass technology is the preferred material among manufacturers for the rear side cover of the modules. Some key advantages of the glass-glass structure are: Glass-glass modules can also be frameless, which helps eliminate the cost of an extruded aluminum frame. However, glass-glass models with frames have a lower risk of breakage.

Differences between bifacial modules and double-glass modules

What are the differences between single-glass and double-glass ...

The benefits of replacing the opaque backsheet with glass outweigh its disadvantages: For a conventional solar panel, when the snow gets thick or people step on it ...
