

Equatorial Guinea bifacial solar panels

Overview

What are bifacial solar panels?

Bifacial solar modules are modules that generate energy on both their front and rear sides, based on solar cells with two active sides. While the energy production of traditional monofacial solar panels is relatively easy to forecast, bifacial panels provide a bit more of a challenge.

Are bifacial panels a monofacial?

Monofacial modules usually include a solid backsheet which blocks any possibility of light capturing on the rear side. However, with bifacial panels, the back side requires a translucent material that allows sunlight to pass through. Many bifacial panel designs, including Trina Solar's, use a double glass structure for this purpose.

Why do bifacial modules have glass panels?

Manufacturers tend to prefer glass panels on both the front and rear sides of a bifacial module because these designs tend to better transmit light and are more resistant to inclement weather, moisture permeation, corrosion, and more excellent mechanical load ability.
