

# Home Energy Storage Project Introduction

#### **Overview**

What is an energy storage project?

An energy storage project is a cluster of battery banks (or modules) that are connected to the electrical grid. These battery banks are roughly the same size as a shipping container. These are also called Battery Energy Storage Systems (BESS), or grid-scale/utility-scale energy storage or battery storage systems.

How does a home energy storage system work?

They can be integrated with household photovoltaic power generation systems (such as solar panels) to store excess electrical energy for use during night-time or rainy days. The working principle of home energy storage systems is relatively simple. Excess energy from the photovoltaic system is stored for later use.

Where are the energy storage projects being built?

The energy storage projects will be located at three existing SCE power substations: 225 MW at Springvale Substation in Big Creek-Ventura, 200 MW at Hinson Substation in the Los Angeles Basin, and 112.5 MW at Etiwanda Substation in the Los Angeles Basin.

What are the benefits of home energy storage system?

Electricity Cost Savings: During peak electricity periods, home energy storage system can release stored energy, thereby reducing household electricity bills. Remote Areas: For remote areas with unstable or unavailable power grids, home energy storage system can provide a reliable electricity supply.

What is the DOE energy storage program?

The goal of the DOE Energy Storage Program is to develop advanced energy storage technologies and systems in collaboration with industry, academia, and government institutions that will increase the reliability, performance, and

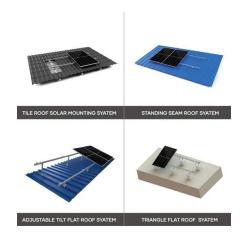

sustainability of electricity generation and transmission in the electric grid and in standalone systems.

What are the different types of energy storage systems?

In practice these systems can include ice storage systems that use electricity to freeze ice which can later be used to run a cooling system, or a heating system that heats bricks in a furnace to later provide heat to a building. Fuel cells: hydrogen fuel cells comprise a third category of energy storage system.
