

# How many amps should an outdoor power supply use

### **Overview**

In ground units offer the option of 63 amps or 125 amps and power bollards provide up to 125 amps. The sockets in all can be configured to suit usage requirements. These units can also be designed to provide a water supply or data connectivity. How many amps do I need for a small event?

This would be an outdoor setting, keyboard, electric guitars, amps, microphones and show lighting. Thanks! No way to tell for certain without numbers. It can be done on as little as a single 120V 15A outlet for say a small back-yard event with a couple, three amps (i.e. amplifiers) and a few lights.

How many amps do I need for a light receptacle?

(Some local codes require lighting circuits to be limited to 15 amps) Again, your electrician will know the local requirements. Three 20 amp general purpose receptacle circuits. (My 4.5 gallon air compressor shares one of these circuits) One 20 amp circuit for the lighting.

What type of outdoor outlet should I Choose?

The power requirement of the devices you plan to use also determines the type of outdoor outlet you should choose. If you're planning on operating highwattage appliances, a higher amp outdoor outlet would be required. In dealing with outdoor electricity, safety is paramount. Here are some safety measures to consider:

How many volts can a 240V subpanel supply?

Your electrician should do these calculations for you. Remember, a 60A, 240V subpanel can provide up to 120 amps of standard 120 volt circuits. As for standard receptacles, I would put them all on 20 amp circuits and I would put the lights on a 20 amp circuit too if your local code allows.

Can you plug a power tool into an outdoor outlet?

Just like an indoor outlet, you can plug any device or appliance into an outdoor

outlet as long as the outlet can provide sufficient power for the device. However, remember to consider the weather and other outdoor factors before leaving or operating the device. Can outdoor outlets power larger devices like power tools or grills?

Yes.

Should I get a 60 amp or 100 amp sub?

I truly believe that a 60 amp sub would serve you well, but I also believe a 100 amp will give you more slots (more circuits) and plenty of power if you decide to, say, buy a small welder; or some other high current draw tool. Make all your circuits (120V and 240V) 20 amp, and you still have room for any larger ones you might need in the future.

### How many amps should an outdoor power supply use
