

How much electricity bill can I use to install an energy storage power station

Overview

Should I install a battery or energy storage system?

Installing an energy storage system can help you prepare for a PSPS or other outage types. A battery will use stored grid or solar energy to keep your home running when grid power is disconnected.

Should I install energy storage?

If your main electrical panel is configured to only have critical load (e.g., a few lights, refrigerator, A/C) on, your energy storage system will last longer. If you install energy storage, you can also take advantage of load-shifting to maximize your energy consumption during off-peak pricing and benefit from Time-of-Use (TOU) pricing control.

When can I use my solar battery to power my home?

Discharging: You can use the energy stored by your battery to power your home or business when the price of electricity from the grid is more expensive, at night when your solar system isn't producing (if you have solar), or during an outage when you need backup power.

Do I NEED Solar to qualify for energy storage?

No, you do not need to have solar to qualify for this program. Energy storage allows for self-supply during outages for added resiliency. If your main electrical panel is configured to only have critical load (e.g., a few lights, refrigerator, A/C) on, your energy storage system will last longer.

How does a solar and energy storage system controller work?

The solar and energy storage system controller is generally programmed by the installer to direct the energy to the appropriate system to maximize the customer's rate plan to offset Time-Of-Use time periods.

Can I use load-shifting if I install energy storage?

If you install energy storage, you can also take advantage of load-shifting to maximize your energy consumption during off-peak pricing and benefit from Time-of-Use (TOU) pricing control. How do I apply?
