

# Is micro inverter expensive

## Overview

---

Microinverters are generally more expensive than string inverters. While you'll likely have better overall system performance with microinverters, it's important to ensure that the long-term performance benefit outweighs the upfront cost. How much does a microinverter cost?

Microinverters typically cost a couple of hundred dollars per unit. While they offer many advantages, which we will cover further, microinverters are notably costlier than string inverters when installed on an entire solar power system. Check out this video from Enphase to learn more about microinverters and their benefits.

How much does a solar inverter cost?

**Higher Upfront Cost:** Microinverters are typically more expensive than traditional inverters, as you need one microinverter for each solar panel. The price of a microinverter system can be \$0.20 to \$0.30 per watt, whereas traditional string inverters generally cost about \$0.10 per watt.

What is the difference between a microinverter and a traditional inverter?

Traditional inverters are bigger and bulkier, making them difficult to carry and install. Microinverters are much smaller, slightly larger than the junction box on a solar panel, and weigh around 2-4 lbs. Microinverters typically cost a couple of hundred dollars per unit.

Are microinverters better than string inverters?

While traditional string inverters connect multiple panels to a single inverter, microinverters operate at the individual panel level. They can optimize the conversion process to boost your solar panel system's efficiency. Let's dive deeper into microinverters, their technology, and how they compare to other inverters.

What is the difference between a solar inverter and a microinverter?

Traditional inverters connect to an entire solar array or string, which can be anywhere from a couple to hundreds of individual solar panels. On the contrary, microinverters are connected to each solar module and are usually mounted on the racking system. Traditional inverters are bigger and bulkier, making them difficult to carry and install.

What happens if a microinverter goes bad?

If something is wrong with one microinverter, only the panel attached to it will shut down instead of the entire system. Diagnosing and fixing issues with microinverters is often quicker than with central string inverters.

Microinverters can easily grow with your solar panel system over the years.
