

# Operational price of allvanadium redox flow battery

#### **Overview**

In 2023, the average VFB system cost ranged between \$400-\$800 per kWh for commercial installations – a figure that masks both challenges and opportunities. Vanadium electrolyte constitutes 30-40% of total system costs. What is the economic model for vanadium redox flow battery?

A techno-economic model for vanadium redox flow battery is presented. The method uses experimental data from a kW-kWh-class pilot plant. A market analysis is developed to determine economic parameters. Capital cost and profitability of different battery sizes are assessed. The results of prudential and perspective analyses are presented.

Are redox flow batteries cheaper than chemistries?

Researchers from MIT have demonstrated a techno-economic framework to compare the levelized cost of storage in redox flow batteries with chemistries cheaper and more abundant than incumbent vanadium.

What is a redox flow battery?

Although there are many different flow battery chemistries, vanadium redox flow batteries (VRFBs) are the most widely deployed type of flow battery because of decades of research, development, and testing. VRFBs use electrolyte solutions with vanadium ions in four different oxidation states to carry charge as Figure 2 shows.

What is a vanadium redox flow battery (VRFB)?

The vanadium redox flow battery (VRFB) is arguably the most well-studied and widely deployed RFB system. At the time of writing, there are approximately 330 MW of VRFBs currently installed around the world with many more systems announced or under development, including a 200 MW/800 MWh plant in Dalian, China [15, 16].

Are vanadium flow batteries a good choice for energy storage?

Vanadium flow batteries are one of the most promising large-scale energy storage technologies due to their long cycle life, high recyclability, and safety credentials. However, they have lower energy density compared to ubiquitous lithium-ion batteries, and their uptake is held back by high upfront cost.

Will flow battery suppliers compete with metal alloy production to secure vanadium supply?

Traditionally, much of the global vanadium supply has been used to strengthen metal alloys such as steel. Because this vanadium application is still the leading driver for its production, it's possible that flow battery suppliers will also have to compete with metal alloy production to secure vanadium supply.
