Overview

What is a double conversion in a power inverter?

The double-conversion eliminates all mains power disturbances. A rectifier converts the alternating current (AC) from the mains to direct current (DC). This DC charges the batteries and powers the inverter. On the basis of this DC voltage, the inverter generates a sinusoidal AC voltage, which permanently supplies the loads.

What is an unregulated doubling/inverting charge pump?

Analog Devices' family of unregulated doubling/inverting charge pumps are used to either boost/double or invert an input voltage to an unregulated output voltage. By eliminating the inductor, these switched capacitor converters offer a small solution footprint and a simpler design than conventional inductive switchers.
