

Requirements for the layout of temperature sensors in energy storage containers

Overview

What are the temperature control requirements for container energy storage batteries?

In view of the temperature control requirements for charging/discharging of container energy storage batteries, the outdoor temperature of 45 °C and the water inlet temperature of 18 °C were selected as the rated/standard operating condition points.

How much energy does a container storage temperature control system use?

The average daily energy consumption of the conventional air conditioning is 20.8 % in battery charging and discharging mode and 58.4 % in standby mode. The proposed container energy storage temperature control system has an average daily energy consumption of 30.1 % in battery charging and discharging mode and 39.8 % in standby mode. Fig. 10.

What is the COP of a container energy storage temperature control system?

It is found that the COP of the proposed temperature control system reaches 3.3. With the decrease of outdoor temperature, the COP of the proposed container energy storage temperature control system gradually increases, and the COP difference with conventional air conditioning gradually increases.

Where should a temperature sensor be located?

Temperature sensors must be located on the top side of each hot and cold aisle within the BESS container. This positioning ensures accurate temperature readings that reflect the variations in the container, which are critical for controlling the HVAC system.

How to choose a compressor for a container energy storage battery?

In view of the temperature control requirements for charging/discharging of container energy storage batteries, the selection of the compressor is based on the rated operating condition of the system at 45 °C outdoor temperature

and 18 °C water inlet temperature to achieve 60 kW cooling capacity.

Do cooling and heating conditions affect energy storage temperature control systems?

An energy storage temperature control system is proposed. The effect of different cooling and heating conditions on the proposed system was investigated. An experimental rig was constructed and the results were compared to a conventional temperature control system.
