

Solar panel usage and silver paste ratio

Overview

Why is silver paste used in solar panels?

It is crucial for manufacturing photovoltaic (PV) solar panels because of its high electrical conductivity. Its primary application in solar cells is as a silver paste, which is applied to silicon wafers. This paste forms fine grid-like patterns known as "fingers" and "busbars" on the surface of the surface of solar cells.

How much silver does a solar panel use?

Silver is so crucial that it can equate up to 6 percent of the total cost of building each unit of the panel. The average panel of approximately 2 square meters can use up to 20 grams of silver. There's a silver paste in the solar photovoltaic (PV) cells that collects the electrons generated when the sunlight hits the panel.

Why is silver important for solar energy production?

Current panel efficiency levels range between 15% and 20%, making silver a necessary factor for energy production expansion. Professionals expect technological advancements to increase the panels' electricity outputs. Increasing efficiency while reducing silver usage requires PV research.

Why do photovoltaic panels use silver paste on the back side?

The silver paste on the back side mainly plays the role of adhesion, and is mostly used on the backlit side of P-type cells. Therefore, the silver paste on the front side of photovoltaic panels requires a higher level of production process and electrical conductivity.

Will halving the amount of silver needed to make solar cells affect demand?

Halving the amount of silver needed to make solar cells, combined with fewer, more efficient modules, will affect global demand for the commodity. Image: Armin Kübelbeck, Wikimedia Commons.

How much silver is used in solar cells?

The report's authors explain the amount of silver used in solar cell manufacturing has already decreased to a much larger extent, from 400 to 130 mg between 2007 and 2016. The authors also predict cell output will grow from 4.7 W now to 6 W by 2030, contributing to a 10.5 mg reduction in silver use per Watt, the report notes.
