

Solar system area

Overview

The Solar System currently moves through a cloud of interstellar medium called the Local Cloud. The closest star to the Solar System, Proxima Centauri, is 4.25 light-years (269,000 AU) away. Both are within the Local Bubble, a relatively small 1,000 light-years wide region of the Milky Way.

The Solar System consists of the Sun and the objects that it. The name comes from Sōl, the Latin name for the . It when a dense region of a collapsed, creating.

PastThe Solar System formed at least 4.568 billion years ago from the gravitational collapse of a region within a large . This initial cloud was likely several light-years across and probably birthed.

The Sun is the Solar System's star and by far its most massive component. Its large mass (332,900), which comprises 99.86% of.

The outer region of the Solar System is home to the and their large moons. The and many orbit.

The Solar System includes the Sun and all objects that are bound to it by gravity and orbit it.The describes the Solar.

Astronomers sometimes divide the Solar System structure into separate regions. The includes Mercury, Venus, Earth, Mars, and the bodies in the . The includes Jupiter, Saturn, Uranus, Neptune, and the bodies in the .

The inner Solar System is the region comprising the terrestrial planets and the . Composed mainly of and metals, the.

Short answer: The Solar System is a disc shape, 244 astronomical units wide (244 times the distance from the Sun to the Earth, or about 36.6 billion km). Long answer: There is some disagreement over exactly where the edge of the Solar System is, so there are disagreements over its size.
