

The battery cabinet pops up two batteries at once

Overview

What happens when a battery is connected to a device?

When a battery is connected to a device, a chemical reaction occurs at the anode, causing it to release electrons. These electrons then flow through the device to the cathode, providing the electrical energy needed to power the device. Once the chemical reaction at the anode is complete, the battery is considered 'dead' or discharged.

What happens if a battery is overcharged?

When a battery is overcharged, the excess energy can cause the electrolyte to heat up and potentially ignite, leading to an explosion. Overcharging can be caused by a faulty charger, a malfunction in the battery's charging circuit, or simply leaving the battery connected to the charger for too long.

Can a battery explode?

Physical damage to a battery can also lead to an explosion. This can occur if the battery is punctured, crushed, or otherwise physically compromised. Damage can cause a short circuit, leading to a rapid discharge of energy and a potential explosion.
