

The lithium battery pack has a string of overcharge protection

Overview

Lithium-ion batteries have integrated protection circuits that prevent overcharging. These circuits monitor the voltage levels and stop charging once the battery reaches its optimal capacity. Are lithium batteries safe?

Lithium batteries have the advantage of high energy density. However, they require careful handling. This article discusses important safety and protection considerations when using a lithium battery, introduces some common battery protection ICs, and briefly outlines selection of important components in battery protection circuits. Overcharge.

Can a lithium battery be overcharged?

Lithium batteries can be safely charged to 4.1 V or 4.2 V/cell, but no higher. Overcharging causes damage to the battery and creates a safety hazard, including fire danger. A battery protection circuit should be used to prevent this. Over-discharge Lithium batteries are completely empty when discharged to 2.5 V/cell.

How do battery protection circuits work?

How battery protection circuits work Battery protection ICs typically use MOSFETs to switch lithium cells in and out of circuit. Lithium cells of the same age and part number can be paralleled and share one protection circuit. Figure 1 is a typical application schematic for a Texas Instruments BQ29700.

Can you use a lithium ion battery on a regular charge?

Use only lithium-ion cells with a designated protection circuit and approved charger. Discontinue using the battery and/or charger if the pack temperature rises more than 10° C (18° F) on a regular charge. The electrolyte is highly flammable and battery rupture can cause physical injury.

How do you prevent a battery from over-discharging?

To prevent the battery from over-discharging, a control circuit cuts off the

current path at about 2.20V/cell. Each cell in a string needs independent voltage monitoring. The higher the cell count, the more complex the protection circuit becomes. Four cells in series had been the practical limit for consumer applications.

Does a battery management system protect your battery?

Not quite. A Battery Management System (BMS) is built into most lithium batteries and provides internal protection. But it doesn't always protect the external load side of the system. A battery protector is an external device that safeguards the entire system, not just the battery cell.

The lithium battery pack has a string of overcharge protection

<u>Understanding Lithium Battery Over Discharge</u> <u>Protection for ...</u>

Over discharge protection is typically integrated into lithium battery management systems (BMS). These systems monitor the voltage and current of each cell in a battery pack ...
