

# Thickness of photovoltaic singlewave and double-wave solar panels

#### **Overview**

Why do solar cells depend on a photovoltaic effect?

Solar cells depend on a phenomenon known as the photovoltaic effect, discovered by French physicist Alexandre Edmond Becquerel (1820-1891). It is related to the photoelectric effect, a phenomenon by which electrons are ejected from a conducting material when light shines on it.

How thick should a polycrystalline panel be?

1. Standard thickness for most polycrystalline and monocrystalline panels tends to be around 3.2 to 4 millimeters, which allows for effective light absorption and structural integrity. 2. Thicker panels, while more durable, can increase weight, presenting challenges for installation on certain structures.

Why do photovoltaic cells respond better to light?

The shorter the wavelength of incident light, the higher the frequency of the light and the more energy possessed by ejected electrons. In the same way, photovoltaic cells are sensitive to wavelength and respond better to sunlight in some parts of the spectrum than others.
