

# Ways to participate in grid energy storage

#### **Overview**

PHS systems pump water from a low to high reservoir, and release it through a turbine using gravity to convert potential energy to electricity when needed17,18, with long lifetimes (50-60 years)17.

What is grid energy storage?

Grid energy storage, also known as large-scale energy storage, are technologies connected to the electrical power grid that store energy for later use. These systems help balance supply and demand by storing excess electricity from variable renewables such as solar and inflexible sources like nuclear power, releasing it when needed.

How can energy storage make grids more flexible?

Energy storage is one option to making grids more flexible. An other solution is the use of more dispatchable power plants that can change their output rapidly, for instance peaking power plants to fill in supply gaps.

Can electric vehicles be used for grid energy storage?

The electric vehicle fleet has a large overall battery capacity, which can potentially be used for grid energy storage. This could be in the form of vehicle-to-grid (V2G), where cars store energy when they are not in use, or by repurposing batteries from cars at the end of the vehicle's life.

What are the different types of grid storage?

As of 2023, the largest form of grid storage is pumped-storage hydroelectricity, with utility-scale batteries and behind-the-meter batteries coming second and third. Lithium-ion batteries are highly suited for shorter duration storage up to 8 hours. Flow batteries and compressed air energy storage may provide storage for medium duration.

Will energy storage change the dynamics of a grid?

With widespread grid failures on this scale, energy storage would have to make up a much larger share of system capacity than it currently does to

change the dynamics, although it can respond to sudden system fluctuations by providing ancillary services, like frequency and voltage regulation.

Does a power grid match electricity production to consumption?

Any electrical power grid must match electricity production to consumption, both of which vary significantly over time. Energy derived from solar and wind sources varies with the weather on time scales ranging from less than a second to weeks or longer.
